

Android USB Communicator

Finally, a USB communication tool for Android devices for users that are restricted to cabled USB connections only. This tool allows for seamless USB communication between a PC and an Android device. It allows data to flow into and out of any Android device that this tool is configured with. This includes lookup tables that need to be loaded onto an Android device or a data file on the device that needs to be transferred to a PC. This tool provides a safe reliable way to sync data.

Communicator Interface

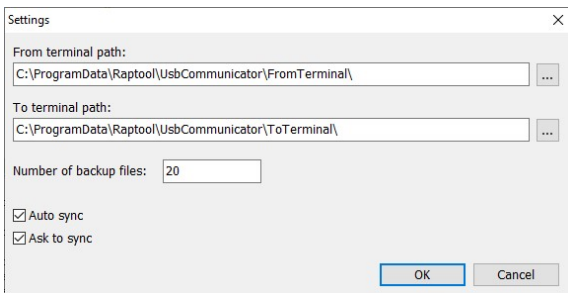

Android USB Communicator uses a simple interface that is installed and runs on the PC. It allows the user to setup one or more Android devices to communicate to it through a PC.

The top portion shows the devices that are licensed to use it. The bottom portion shows a log of activities with these devices.

Android USB Communicator Setup

Setup is simple. Once Communicator is installed, the path of the data to and from the device is configured.

Once this setup is done, any lookup files can be easily loaded onto your Android devices. Also, data files on the devices can be transferred to the PC using Communicator.

Secure Data Transfer

This is one of the most secure data transfer methods known. Data can only be transferred between the PC and the Android devices through a cabled USB connection. This eliminates security issues with WIFI or Bluetooth. Android USB Communicator can be setup to only transfer under your requirements and only through direct USB transfers.

Android App Development

This tool works in conjunction with MSS Software's app development. MSS develops custom Android applications for a variety of programs. If you require secure USB data transfers, then please contact us for more information on how we can develop a data collection program and secure the data transfer through our Android USB Communicator.
